Quantstamp Security Assessment Certificate

May 26th 2022 — Quantstamp Verified

Sandbox Ethereum Land

This audit report was prepared by Quantstamp, the leader in blockchain security.

Executive Summary

Type	Decentralized Gaming Platform
Auditors	David Knott, Senior Research Engineer Ed Zulkoski, Senior Security Engineer Fatemeh Heidari, Security Auditor
Timeline	2022-05-02 through 2022-05-26
EVM	Arrow Glacier
Languages	Solidity
Methods	Architecture Review, Unit Testing, Computer-Aided Verification, Manual Review
Specification	Sandbox Online Documentation
Documentation Quality	Low
Test Quality	Medium

Source Code

Repository	Commit
sandbox-smart-contracts-private	a60c8bf7
sandbox-smart-contracts-private	2a32f6b

Total Issues	**9** (4 Resolved)
High Risk Issues	**1** (0 Resolved)
Medium Risk Issues	0 (0 Resolved)
Low Risk Issues	**5** (3 Resolved)
Informational Risk Issues	**3** (1 Resolved)
Undetermined Risk Issues	0 (0 Resolved)

High Risk	The issue puts a large number of users' sensitive information at risk, or is reasonably likely to lead to catastrophic impact for client's reputation or serious financial implications for client and users.
Medium Risk	The issue puts a subset of users' sensitive information at risk, would be detrimental for the client's reputation if exploited, or is reasonably likely to lead to moderate financial impact.
Low Risk	The risk is relatively small and could not be exploited on a recurring basis, or is a risk that the client has indicated is low-impact in view of the client's business circumstances.
Informational	The issue does not post an immediate risk, but is relevant to security best practices or Defence in Depth.
Undetermined	The impact of the issue is uncertain.

Unresolved	Acknowledged the existence of the risk, and decided to accept it without engaging in special efforts to control it.
Acknowledged	The issue remains in the code but is a result of an intentional business or design decision. As such, it is supposed to be addressed outside the programmatic means, such as: 1) comments, documentation, README, FAQ; 2) business processes; 3) analyses showing that the issue shall have no negative consequences in practice (e.g., gas analysis, deployment settings).
Fixed	Adjusted program implementation, requirements or constraints to eliminate the risk.
Mitigated	Implemented actions to minimize the impact or likelihood of the risk.

Summary of Findings

Quantstamp has performed a security audit of Sandbox's Ethereum Mainnet Land Solidity version `0.5.x` smart contracts and has identified 9 security issues ranging from High to Informational risk levels. Notably, we found that superusers have the ability to arbitrarily transfer ownership of Sandbox Lands. We recommend that all issues be addressed prior to any smart contract upgrades.

ID	Description	Severity	Status
QSP-1	Centralization Risk	High	Acknowledged
QSP-2	Fixed Stored Metadata	Low	Acknowledged
QSP-3	ERC2771 Meta Transactions Not Supported For Superusers	Low	Acknowledged
QSP-4	ERC721 Token Contracts Not Able To Accept Batches	Low	Fixed
QSP-5	Metatransaction Contracts Can Be Externally Owned Accounts	Low	Fixed
QSP-6	Missing Input Validation	Low	Fixed
QSP-7	Renounceable Admin	Informational	Acknowledged
QSP-8	Unlocked Pragma	Informational	Fixed
QSP-9	Function Shadowing	Informational	Acknowledged

Quantstamp Audit Breakdown

Quantstamp's objective was to evaluate the repository for security-related issues, code quality, and adherence to specification and best practices.

DISCLAIMER:
The LAND smart contracts currently deployed on Ethereum Mainnet differ from those audited. In-between the audit and the re-audit the audited smart contracts were postfixed with "V2", audit fixes were made to the "V2" contracts, and the initially audited smart contracts were reverted to a pre-audit state. The "V2" contracts were reviewed for audit fixes. The Sandbox team made these changes to keep the code of the first version deployed on Ethereum Mainnet intact. Given that the smart contracts currently deployed to Ethereum Mainnet were not under the scope of the audit, auditors could not check whether the code being audited is upgrade compatible with the currently deployed Ethereum Mainnet smart contracts.

Possible issues we looked for included (but are not limited to):

- Transaction-ordering dependence
- Timestamp dependence
- Mishandled exceptions and call stack limits
- Unsafe external calls
- Integer overflow / underflow
- Number rounding errors
- Reentrancy and cross-function vulnerabilities
- Denial of service / logical oversights
- Access control
- Centralization of power
- Business logic contradicting the specification
- Code clones, functionality duplication
- Gas usage
- Arbitrary token minting

Methodology

The Quantstamp auditing process follows a routine series of steps:

1. Code review that includes the following
   i. Review of the specifications, sources, and instructions provided to Quantstamp to make sure we understand the size, scope, and functionality of the smart contract.
   ii. Manual review of code, which is the process of reading source code line-by-line in an attempt to identify potential vulnerabilities.
   iii. Comparison to specification, which is the process of checking whether the code does what the specifications, sources, and instructions provided to Quantstamp describe.
2. Testing and automated analysis that includes the following:
   i. Test coverage analysis, which is the process of determining whether the test cases are actually covering the code and how much code is exercised when we run those test cases.
   ii. Symbolic execution, which is analyzing a program to determine what inputs cause each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, and actionable recommendations to help you take steps to secure your smart contracts.

Findings

QSP-1 Centralization Risk

Severity: *High Risk*

Status: Acknowledged

File(s) affected: `src/solc_0.5/contracts_common/BaseWithStorage/AdminV2.sol`, `src/solc_0.5/contracts_common/BaseWithStorage/SuperOperatorsV2.sol`, `src/solc_0.5/contracts_common/BaseWithStorage/MetaTransactionReceiverV2.sol`, `src/solc_0.5/Land/erc721/ERC721BaseTokenV2.sol`

Description: The `ERC721BaseTokenV2` uses a lists of “super operators” and "meta transaction contracts" which can be assigned and removed by the contract `admin`. Both roles have the ability to `transfer` and ` approve ERC721 token transfers on behalf of any address at any time. There is no limitation or opt-out to this ability.

Recommendation: It is recommended that these abilities either be removed or strongly mediated (e.g., via decentralized governance). If these features are to be kept and operated in a centralized manner, end-user documentation should be added informing users of the associated risks.

Update: The Sandbox team states that in “the near future, Sandbox will introduce a DAO to decentralize the governance. In the long run, the admin role can also be renounced.”

QSP-2 Fixed Stored Metadata

Severity: *Low Risk*

Status: Acknowledged

File(s) affected: `src/solc_0.5/LandV2.sol`

Description: The metadata retrieval method `tokenURI` returns an HTTP-based metadata address where the parent domain is fixed. This can be problematic due to two factors:

- Centrally stored: Metadata stored on a specific domain is subject to being changed by the domain owner and introduces a central failure point.
- Fixed: The fixing of URL structure to a specific parent domain disallows future upgrades. This may be important in the case of, e.g., re-branding efforts or if progressive decentralization is desired.

Recommendation: It is recommended that token asset metadata be changeable to allow for future flexibility. Furthermore, it is also recommended that asset metadata be stored immutably and in a decentralized way whenever possible to remove central points of failure and the risk of metadata loss.

Update: The Sandbox team states that in “order to remain flexible, the asset metadata are centrally stored.”

QSP-3 ERC2771 Meta Transactions Not Supported For Superusers

Severity: *Low Risk*

Status: Acknowledged

File(s) affected: `src/solc_0.5/contracts_common/BaseWithStorage/AdminV2.sol`, `src/solc_0.5/contracts_common/BaseWithStorage/SuperOperatorsV2.sol`, `src/solc_0.5/contracts_common/BaseWithStorage/MetaTransactionReceiverV2.sol`, `src/solc_0.5/Land/erc721/ERC721BaseTokenV2.sol`, `src/solc_0.5/Land/erc721/LandBaseTokenV2.sol`

Description: The contracts specified above directly utilize solidity's `msg.sender` instead of relying on an OpenZeppelin `Context` contract. This prevents the contracts superusers from leveraging `ERC2771` meta transactions, as they will have to be the direct `msg.sender` when calling methods.

Recommendation: Use OpenZeppelin's `Context` contract and the inherited `_msgSender` method in the referenced contracts. This allows the methods using `msg.sender` to receive `ERC2771` meta transaction support in child contracts.

Update: The Sandbox team states that the “LAND contract doesn’t handle ERC2771 at all.”

QSP-4 ERC721 Token Contracts Not Able To Accept Batches

Severity: *Low Risk*

Status: Fixed

File(s) affected: `src/solc_0.5/Land/erc721/ERC721BaseTokenV2.sol`

Description: Contracts which comply with the `ERC721` standard and implement the `onERC721Received` method may not be able to accept ERC721 tokens sent to them as part of a batch. This is due to the `ERC721BaseTokenV2` contract expecting a custom `onERC721BatchReceived` check. While having a single checking method may allow for validation to be more efficient, requiring it will prevent compliant contracts from accepting tokens sent to it in a batch.

Recommendation: It is recommended that the `ERC165` standard be used to check whether receiving contracts support the special batch accepting procedure, and revert to repeated calls to the standard `onERC721Received` method if `onERC721BatchReceived` is not supported. This approach allows specific contracts to directly validate batched transfers while still supporting normal ERC721 compliant receiving contracts.

QSP-5 Metatransaction Contracts Can Be Externally Owned Accounts

Severity: *Low Risk*

Status: Fixed

File(s) affected: `src/solc_0.5/contracts_common/BaseWithStorage/MetaTransactionReceiverV2.sol`

Description: `MetaTransactionReceiverV2` uses the mapping `_metaTransactionContracts` to determine whether a given address is whitelisted to make meta transactions. However `_setMetaTransactionProcessor`, which configures `_metaTransactionContracts`, does not check whether the address being configured is actually a contract. This lack of validation can lead to an inconsistent contract state where an Externally Owner Account is able to act as a `_metaTransactionContract`.

Recommendation: Modify `_setMetaTransactionProcessor` to check wether the `metaTransactionProcessor` address being configured is a contract.

QSP-6 Missing Input Validation

Severity: *Low Risk*

Status: Fixed

File(s) affected: `src/solc_0.5/contracts_common/BaseWithStorage/AdminV2.sol`, `src/solc_0.5/contracts_common/BaseWithStorage/SuperOperatorsV2.sol`, `src/solc_0.5/contracts_common/BaseWithStorage/MetaTransactionReceiverV2.sol`, `src/solc_0.5/Land/erc721/ERC721BaseTokenV2.sol`, `src/solc_0.5/Land/erc721/LandBaseTokenV2.sol`

Description: Input validation for protocol configuration and administration is critical as the misseting of any parameters can cause the protocol to not behave as expected. The following functions are missing input validation and can be misset:

- `src/solc_0.5/contracts_common/BaseWithStorage/AdminV2.sol::L17(changeAdmin)` should check whether `newAdmin` is the 0 address and whether it is the same address as the current `admin`.
- `src/solc_0.5/contracts_common/BaseWithStorage/SuperOperatorsV2.sol::L14(setSuperOperator)` should check whether `superOperator`s are the 0 address and whether they have already been whitelisted as a `superOperator`.
- `src/solc_0.5/Land/erc721/LandBaseTokenV2.sol::L23` should check whether `minter`s are the 0 address and whether they have already been whitelisted as a `minter`.

Recommendation: Add input validation checks to all the functions specified above.

QSP-7 Renounceable Admin

Severity: *Informational*

Status: Acknowledged

File(s) affected: `src/solc_0.5/contracts_common/BaseWithStorage/AdminV2.sol`

Description: `AdminV2`'s `changeAdmin` function does not perform any validation checks on `newAdmin`. This makes `admin` role renunciation possible, which would result in the forfeiting of access to all `admin` functionality.

Recommendation: Remove `changeAdmin` and add `proposeAdmin`, which will propose a `newAdmin`, and `acceptAdmin`, which would allow the `newAdmin` to accept the `admin` role.

Update: The Sandbox team states that in “the long run, the admin role will be renounced.”

QSP-8 Unlocked Pragma

Severity: *Informational*

Status: Fixed

File(s) affected: `src/solc_0.5/contracts_common/Libraries/AddressUtils.sol`, `src/solc_0.5/contracts_common/BaseWithStorage/AdminV2.sol`, `src/solc_0.5/contracts_common/BaseWithStorage/SuperOperatorsV2.sol`, `src/solc_0.5/contracts_common/BaseWithStorage/MetaTransactionReceiverV2.sol`, `src/solc_0.5/contracts_common/Interfaces/ERC721TokenReceiver.sol`, `src/solc_0.5/contracts_common/Interfaces/ERC721Events.sol`, `src/solc_0.5/contracts_common/Interfaces/ERC721MandatoryTokenReceiver.sol`

Related Issue(s): SWC-103

Description: Every Solidity file specifies in the header a version number of the format `pragma solidity (^)0.5.*`. The caret (^) before the version number implies an unlocked pragma, meaning that the compiler will use the specified version *and above*, hence the term "unlocked".
The files listed above specify a Solidity pragma version of `^0.5.2` which means they can be compiled with any minor Solidity version release greater than or equal to `0.5.2`.

Recommendation: Change the Solidity version of the files listed above to `0.5.9` to match the other audited contracts' Solidity version and lock it.

QSP-9 Function Shadowing

Severity: *Informational*

Status: Acknowledged

File(s) affected: `src/solc_0.5/Land/erc721/ERC721BaseTokenV2.sol`, `src/solc_0.5/Land/erc721/LandBaseTokenV2.sol`

Description: When smart contract's implement functionality that is never used and overridden, it decreases readability, increasing the chances that reviewers will have an incorrect understanding of how said smart smart contracts function. All functions in Solidity version's before `0.6.x` are implicitly `virtual` and therefore overridable. `ERC721BaseTokenV2` implements both `_ownerOf` and `_ownerAndOperatorEnabledOf`, both of which are overridden in `LandBaseTokenV2`.

Recommendation: Remove the implementation of `_ownerOf` and `_ownerAndOperatorEnabledOf` from `ERC721BaseToken`.

Update: The Sandbox team states that “the base contract ERC721BaseToken is used by other contracts. We considered overall homogeneity over small gas optimization here.”

Code Documentation

- **Acknowledged**: `src/solc_0.5/contracts_common/Interfaces/ERC721MandatoryTokenReceiver.sol`:: L22: contains a commented out `supportsInterface` function. Either uncomment it if it is meant to be part of the `IERC721MandatoryTokenReceiver` interface, or remove it.
- **Fixed**: `src/solc_0.5/contracts_common/Interfaces/ERC2771Handler.sol`: L6: Comments that `ERC2771Handler` is based off of OpenZeppelin's implementation. Change the comment to reference a tagged version of the contract code that `ERC2771Handler` is based on to future-proof the comment from changes to OpenZeppelin's master branch. Also, add comments listing what functionality was changed from OpenZeppelin's implementation to increase readability.
- **Fixed**: `src/solc_0.5/Land/erc721/LandBaseTokenV2.sol`: L155: "allow" is misspelled as "alow.”

Adherence to Best Practices

- **Acknowledged**: Call `_ownerOf` from `_ownerAndOperatorEnabledOf` in `src/solc_0.5/Land/erc721/LandBaseTokenV2.sol` instead of reimplementing ownership checking functionality in `_ownerAndOperatorEnabledOf` to increase readability and decrease deployment costs.
- **Acknowledged**: Add indexing to all events to make them easier for end-users and block explorers to filter for.

• **Unresolved**: Restrict function's visibility as much as possible to minimize the chances of misuse. The following function's visibilities should be changed from `public` to `external`:

  . `src/solc_0.5/contracts_common/BaseWithStorage/SuperOperatorsV2.sol::L26(isSuperOperator)`

  . `src/solc_0.5/Land/erc721/ERC721BaseTokenV2.sol::L32(initialize)`

  . `src/solc_0.5/LandV2.sol::L49(tokenURI)`

• **Fixed**: `src/solc_0.5/contracts_common/BaseWithStorage/AdminV2.sol`: L18+19: Repeated retrieval of storage variable `_admin`. The `_admin` variable is read twice from storage, once on L27 when it's compared to the `msg.sender` and a second time when it's used an event parameter. It is recommended that unchanged storage variables that need to be reused multiple times within a method are stored in an intermediary local variable to save gas.

• **Fixed**: Privileged checks before user-checks (`src/solc_0.5/Land/erc721/ERC721BaseTokenV2.sol` L101, L120, L151, L250, L381; `src/solc_0.5/Land/erc721/LandBaseTokenV2.sol` L174, L228). It is checked whether the `msg.sender` is a "super operator" before whether the `msg.sender` is an "operator for all". It is recommended the "super operator" check be placed after the "operator for all" check in the OR-chain (`||`). This will improve gas usage for the average user while slightly increasing the gas cost of the methods for "super operators".

• **Unresolved**: `src/solc_0.5/Land/erc721/ERC721BaseTokenV2.sol`: L172-186: Manual call data construction. While limiting the amount of gas passed for calls is generally not recommended as the gas cost of opcodes may be changed limiting gas can be done directly in solidity, without the use of assembly:

```
try
  IERC165(_contract).supportsInterface{gas: 10000}(interfaceID)
  returns (bool result)
{
  return result;
} catch {
  return false;
}
```

• **Acknowledged**: `src/solc_0.5/Land/erc721/ERC721BaseTokenV2.sol`: L323: Unnecessary check. Due to "super operators" having full access already, checking whether they are being approved or/not is unnecessary and adds an additional `SSTORE` operation for every call of `_setApprovalForAll`.

• **Unresolved**: `src/solc_0.5/Land/erc721/ERC721BaseTokenV2.sol`: L230-232: Defined constants underused. The `supportsInterface` method uses the inline defined literal function selector `0x01ffc9a7` and `0x80ac58cd` instead of using the previously defined `ERC165ID` constant.

• **Unresolved**: (`src/solc_0.5/contracts_common/Interfaces/ERC721MandatoryTokenReceiver.sol::L22`, `src/solc_0.5/contracts_common/Interfaces/ERC2771Handler.sol`): Modify both interfaces to follow the `I` prefix interface naming convention.

• **Unresolved**: Reimplementation of access control logic (`src/solc_0.5/contracts_common/BaseWithStorage/AdminV2.sol`, `src/solc_0.5/contracts_common/Libraries/AddressUtils.sol`). `AddressUtils` and `Admin` implement access control patterns already available via common smart contract libraries. It is recommended that `AddressUtils` be replaced with OpenZeppelin's `Address` contract and that the `Admin` contract be replaced with OpenZeppelin's `Ownable` contract.

• **Unresolved**: (`src/solc_0.5/contracts_common/Libraries/AddressUtils.sol`): L9-19: Use `extcodesize` instead of `extcodehash` to check whether an address is a contract address to save gas by avoiding having to check for Externally Owner Accounts.

• **Unresolved**: (`src/solc_0.5/Land/erc721/ERC721BaseTokenV2.sol` L65, L82, L364; `src/solc_0.5/Land/erc721/LandBaseToken.sol` L476): Use `2**255` to denote that an owner has approved and operator for a given 1x1 land and `2**160` to denote that a given land has been burned. Change `2**255` and `2**160` to constants to increase readability.

• **Unresolved**: (`src/solc_0.5/contracts_common/Libraries/AddressUtils.sol`): L5-7: The function `toPayable` is implemented but never used. If there are no imminent plans to use `toPayable`, it should be removed to decrease contract size and increase readability.

• **Fixed**: (`src/solc_0.5/contracts_common/BaseWithStorage/AdminV2.sol`): L23-26: The `onlyAdmin` modifier is declared but it is never used and admin checks throughout the codebase reimplement its functionality. Change all `admin` checks to use the `onlyAdmin` modifier to reduce code size and increase readability.

Test Results

Test Suite Results

The test report was generated with `yarn test`. There were 1315 tests in total, 1310 of which were passing and 5 of which were pending.

> network:    hardhat

  Asset:ERC1155
    bouncerAdmin
Nothing to compile
       ✓ can't set address 0 to bouncerAdmin (2846ms)
    mint
       ✓ minting an item results in a TransferSingle event (146ms)
    transfers
       ✓ transferring one instance of an item results in an ERC1155 TransferSingle event (246ms)
       ✓ transferring multiple instances of an item results in an ERC1155 TransferSingle event (313ms)
       ✓ transferring zero instances of an item results in an ERC1155 TransferSingle event (220ms)
       ✓ transferring an item with 1 supply does not result in an ERC1155 TransferBatch event (240ms)
       ✓ transferring an item with >1 supply does not result in an ERC1155 TransferBatch event (317ms)
       ✓ can be transferred to a normal address (1584ms)
       ✓ cannot be transferred to zero address (215ms)
       ✓ cannot transfer more items than you own (1003ms)
       ✓ cannot transfer an item with supply 1 that you do not own (268ms)
       ✓ cannot transfer an item that you do not own (207ms)
       ✓ cannot transfer more item of 1 supply (164ms)
       ✓ cannot transfer to a contract that does not accept ERC1155 (191ms)
       ✓ cannot transfer multiple instances of an item to a contract that does not accept ERC1155 (145ms)
       ✓ cannot transfer an item of supply 1 to a contract that does not accept ERC1155 (144ms)
       ✓ cannot transfer an item of supply 1 to a contract that does not return the correct ERC1155_IS_RECEIVER value (142ms)
       ✓ cannot transfer an item of supply >1 to a contract that does not return the correct ERC1155_IS_RECEIVER value (155ms)
    batch transfers
       ✓ transferring an item with 1 supply results in an ERC1155 BatchTransfer event (271ms)
       ✓ transferring an item with >1 supply results in an ERC1155 BatchTransfer event (357ms)
       ✓ transferring zero items with 1 supply results in an ERC1155 BatchTransfer event (248ms)
       ✓ transferring zero items with >1 supply results in an ERC1155 BatchTransfer event (245ms)
       ✓ transferring empty list results in an ERC1155 BatchTransfer event (240ms)
       ✓ transferring multiple items results in an ERC1155 BatchTransfer event (658ms)
       ✓ transferring multiple items including zero amount results in an ERC1155 BatchTransfer event (525ms)
       ✓ transferring an item with 1 supply with batch transfer does not result in a TransferSingle event (359ms)
       ✓ transferring an item with >1 supply with batch transfer does not result in a TransferSingle event (363ms)
       ✓ can use batch transfer to send tokens to a normal address (352ms)
       ✓ cannot batch transfer the same token twice and exceed the amount owned (205ms)
       ✓ can use batch transfer to send token twice if there is sufficient amount owned (496ms)
       ✓ cannot batch transfer tokens to zeroAddress (128ms)
       ✓ cannot batch transfer tokens if array lengths do not match (125ms)
       ✓ cannot batch transfer more than the amount owned (137ms)
       ✓ cannot batch transfer more items of 1 supply (133ms)
       ✓ cannot batch transfer to a contract that does not accept ERC1155 (189ms)
```

```
      ✓ cannot batch transfer to a contract that does not return the correct magic value (157ms)
      ✓ can batch transfer to a contract that does accept ERC1155 and which returns the correct magic value (560ms)
      ✓ can batch transfer item with 1 or more supply at the same time (378ms)
      ✓ can obtain balance of batch (372ms)
    approvalForAll
      ✓ setting approval results in ApprovalForAll event (182ms)
      ✓ setting approval fails if sender is operator (134ms)
      ✓ operator cannot transfer without approval (130ms)
      ✓ operator can transfer after approval (385ms)
      ✓ operator cannot transfer after approval is removed (376ms)
    supportsInterface
      ✓ contract claims to supports ERC165 (121ms)
      ✓ contract does not claim to support random interface (124ms)
      ✓ contract does not claim to support invalid interface (126ms)
    ordering
      ✓ transfer empty array (237ms)
      ✓ transfer multiple items in any order (i) (535ms)
      ✓ transfer multiple items in any order (ii) (531ms)
      ✓ transfer multiple items in any order (iii) (497ms)
      ✓ transfer multiple items in any order (iv) (747ms)
      ✓ transfer multiple items in any order (v) (531ms)
      ✓ transfer multiple items in any order (vi) (704ms)
      ✓ transfer multiple items in any order (vii) (620ms)
      ✓ transfer multiple items in any order (viii) (607ms)
      ✓ transfer multiple items in any order twice (i) (801ms)
      ✓ transfer multiple items in any order twice (ii) (1299ms)
      ✓ transfer multiple items in any order twice (iii) (1977ms)
      ✓ transfer multiple items in any order twice (iv) (1547ms)
      ✓ transfer multiple items in any order twice (v) (1067ms)
      ✓ transfer multiple items in any order twice (vi) (1031ms)

  Asset:ERC721
    non existing NFT
      ✓ transfering a non existing NFT fails (102ms)
      ✓ tx balanceOf a zero owner fails (72ms)
      ✓ call balanceOf a zero owner fails (69ms)
      ✓ tx ownerOf a non existing NFT fails (79ms)
      ✓ call ownerOf a non existing NFT fails (67ms)
      ✓ tx getApproved a non existing NFT fails (71ms)
      ✓ call getApproved a non existing NFT fails (69ms)
    balance
      ✓ balance is zero for new user (68ms)
      ✓ balance return correct value (404ms)
    mint
      ✓ mint result in a transfer from 0 event (86ms)
      ✓ mint for gives correct owner (94ms)
    burnAsset
      ✓ burn result in a transfer to 0 event (179ms)
      ✓ burn result in ownerOf throwing (176ms)
    transfer
      ✓ transfering one NFT results in one erc721 transfer event (175ms)
      ✓ transfering one NFT change to correct owner (209ms)
      ✓ transfering one NFT increase new owner balance (191ms)
      ✓ transfering one NFT decrease past owner balance (182ms)
      ✓ transfering from without approval should fails (72ms)
      ✓ transfering to zero address should fails (68ms)
      ✓ transfering to a contract that do not accept erc721 token should not fail (206ms)
    safeTransfer
      ✓ safe transfering one NFT results in one erc721 transfer event (173ms)
      ✓ safe transfering to zero address should fails (74ms)
      ✓ safe transfering one NFT change to correct owner (183ms)
      ✓ safe transfering from without approval should fails (70ms)
      ✓ safe transfering to a contract that do not accept erc721 token should fail (116ms)
      ✓ safe transfering to a contract that do not return the correct onERC721Received bytes shoudl fail (87ms)
      ✓ safe transfering to a contract that do not implemented onERC721Received should fail (118ms)
      ✓ safe transfering to a contract that return the correct onERC721Received bytes shoudl succeed (265ms)
    safeTransfer with empty bytes

    ✓ batch transfering to a contract that do not implemented mandatory receiver should not fail (124ms)
    ✓ batch transfering to a contract that return the correct onERC721Received bytes shoudl succeed (138ms)
  mandatory transfer
    ✓ transfering to a contract that do not implements mandatory erc721 receiver but implement classic ERC721 receiver and reject should not fails (128ms)
    ✓ transfering to a contract that implements mandatory erc721 receiver (and signal it properly via 165) should fails if it reject it (101ms)
    ✓ transfering to a contract that do not accept erc721 token should fail (98ms)
    ✓ transfering to a contract that do not return the correct onERC721Received bytes shoudl fail (91ms)
    ✓ transfering to a contract that do not implemented mandatory receiver should not fail (120ms)
    ✓ transfering to a contract that return the correct onERC721Received bytes shoudl succeed (142ms)
  safe batch transfer
    ✓ safe batch transfer of same NFT ids should fails (84ms)
    ✓ safe batch transfer works (316ms)
  transfer
    ✓ transfering one NFT results in one erc721 transfer event (102ms)
    ✓ transfering one NFT change to correct owner (111ms)
    ✓ transfering one NFT increase new owner balance (116ms)
    ✓ transfering one NFT decrease past owner balance (119ms)
    ✓ transfering from without approval should fails (78ms)
    ✓ transfering to zero address should fails (76ms)
    ✓ transfering to a contract that do not accept erc721 token should not fail (123ms)
  safeTransfer
    ✓ safe transfering one NFT results in one erc721 transfer event (108ms)
    ✓ safe transfering to zero address should fails (76ms)
    ✓ safe transfering one NFT change to correct owner (115ms)
    ✓ safe transfering from without approval should fails (81ms)
    ✓ safe transfering to a contract that do not accept erc721 token should fail (94ms)
    ✓ safe transfering to a contract that do not return the correct onERC721Received bytes shoudl fail (93ms)
    ✓ safe transfering to a contract that do not implemented onERC721Received should fail (91ms)
    ✓ safe transfering to a contract that return the correct onERC721Received bytes shoudl succeed (139ms)
  safeTransfer with empty bytes
    ✓ data:0x : safe transfering one NFT results in one erc721 transfer event (111ms)
    ✓ data:0x : safe transfering to zero address should fails (79ms)
    ✓ data:0x : safe transfering one NFT change to correct owner (118ms)
    ✓ data:0x : safe transfering from without approval should fails (75ms)
    ✓ data:0x : safe transfering to a contract that do not accept erc721 token should fail (90ms)
    ✓ data:0x : safe transfering to a contract that do not return the correct onERC721Received bytes shoudl fail (92ms)
    ✓ data:0x : safe transfering to a contract that do not implemented onERC721Received should fail (90ms)
    ✓ data:0x : safe transfering to a contract that return the correct onERC721Received bytes shoudl succeed (135ms)
  safeTransfer with data
    ✓ data:0xff56fe3422 : safe transfering one NFT results in one erc721 transfer event (112ms)
    ✓ data:0xff56fe3422 : safe transfering to zero address should fails (118ms)
    ✓ data:0xff56fe3422 : safe transfering one NFT change to correct owner (114ms)
    ✓ data:0xff56fe3422 : safe transfering from without approval should fails (79ms)
    ✓ data:0xff56fe3422 : safe transfering to a contract that do not accept erc721 token should fail (93ms)
    ✓ data:0xff56fe3422 : safe transfering to a contract that do not return the correct onERC721Received bytes shoudl fail (86ms)
    ✓ data:0xff56fe3422 : safe transfering to a contract that do not implemented onERC721Received should fail (92ms)
    ✓ data:0xff56fe3422 : safe transfering to a contract that return the correct onERC721Received bytes shoudl succeed (136ms)
  ERC165
    ✓ claim to support erc165 (69ms)
    ✓ claim to support base erc721 interface (75ms)
    ✓ claim to support erc721 metadata interface (72ms)
    ✓ does not claim to support random interface (71ms)
    ✓ does not claim to support the invalid interface (66ms)
  Approval
    ✓ approving emit Approval event (101ms)
    ✓ removing approval emit Approval event (137ms)
    ✓ approving update the approval status (110ms)
    ✓ cant approve if not owner or operator  (114ms)
    ✓ approving allows transfer from the approved party (152ms)
    ✓ transfering the approved NFT results in aproval reset for it (148ms)
    ✓ transfering the approved NFT results in aproval reset for it but no approval event (137ms)
    ✓ transfering the approved NFT again will fail (145ms)
    ✓ approval by operator works (274ms)
  ApprovalForAll
    ✓ approving all emit ApprovalForAll event (89ms)
    ✓ approving all update the approval status (100ms)
    ✓ unsetting approval for all should update the approval status (167ms)
    ✓ unsetting approval for all should emit ApprovalForAll event (162ms)
    ✓ approving for all allows transfer from the approved party (145ms)
    ✓ transfering one NFT do not results in aprovalForAll reset (132ms)
    ✓ approval for all does not grant approval on a transfered NFT (139ms)
    ✓ approval for all set before will work on a transfered NFT (272ms)
    ✓ approval for all allow to set individual nft approve (342ms)

Asset.sol
  ✓ user sending asset to itself keep the same balance (176ms)
  ✓ can transfer assets (49ms)
  ✓ user batch sending asset to itself keep the same balance (45ms)
  ✓ user batch sending in series whose total is more than its balance (53ms)
  ✓ user batch sending more asset that it owns should fails (49ms)
  ✓ can get the chainIndex from the tokenId
  ✓ can get the URI for an NFT (67ms)
  ✓ can get the URI for a FT (62ms)
  ✓ fails get the URI for an invalid tokeId
  ✓ can burn ERC1155 asset (43ms)
  ✓ can burn ERC721 asset (38ms)
  Asset: MetaTransactions
    ✓ can transfer by metaTx (137ms)
    ✓ fails to transfer someone else token by metaTx (84ms)
    ✓ can batch-transfer by metaTx (107ms)

assetSignedAuctionWithAuth
  ✓ should be able to set fee (1603ms)
  ✓ should fail setting fee - no admin
  ✓ should fail is buyer == seller (78ms)
  ✓ should fail is ids.length != amounts.length (62ms)
  ✓ should fail - insuficient amount (76ms)
  ✓ should be able to claim seller offer in ETH (124ms)
  ✓ should NOT be able to claim offer if signature mismatches (73ms)
  ✓ should NOT be able to claim offer with invalid backend signature (49ms)
  ✓ should be able to claim seller offer in SAND (119ms)
  ✓ should be able to claim seller offer with basic signature (102ms)
  ✓ should be able to cancel offer (42ms)
  ✓ should NOT be able to claim offer without sending ETH (80ms)
  ✓ should NOT be able to claim offer without enough SAND (84ms)
  ✓ should NOT be able to claim offer if it did not start yet (48ms)
  ✓ should NOT be able to claim offer if it already ended (52ms)

Asset_Giveaway
  ✓ User cannot claim when test contract holds zero assets (112ms)
  ✓ User can claim allocated multiple assets for multiple assetIds from Giveaway contract (293ms)
  ✓ Claimed Event is emitted for successful claim (50ms)
  ✓ User can claim allocated single asset for single assetId from Giveaway contract
  ✓ User tries to claim the wrong amount of an assetID
  ✓ User cannot claim their assets more than once (53ms)
  ✓ User cannot claim assets from Giveaway contract if destination is not the reserved address
  ✓ User cannot claim assets from Giveaway contract to destination zeroAddress
  ✓ User cannot claim assets from Giveaway contract with incorrect asset param
  ✓ User can claim allocated multiple assets for multiple assetIds from alternate address (295ms)
  ✓ merkleRoot cannot be set twice (68ms)
  ✓ merkleRoot can only be set by admin

GAS:Asset_Giveaway_1:Claiming
  ✓ 1 claim (124ms)
  ✓ 10 claims (130ms)
  ✓ 4000 claims (898ms)
  ✓ 10000 claims (2202ms)
```

```
{
  "Gas per claim - 1 claim total": 123678,
  "Gas per claim - 10 claims total": 128212,
  "Gas per claim - 4000 claims total": 140256,
  "Gas per claim - 10000 claims total": 143280
}

  MerkleTree_assets
     ✓ should validate the data

  SignedGiveaway.sol
    initialization
       ✓ interfaces (395ms)
    roles
       ✓ admin
       ✓ signer
    claim
       ✓ should be able to claim sand (43ms)
       ✓ should fail to claim the same id twice
       ✓ should fail to claim if the signature is wrong
       ✓ should fail to mint if the signer is invalid
       ✓ claim with metaTX trusted forwarder
    revoke
       ✓ should fail to revoke if not admin
       ✓ should fail to claim if the id was revoked
    pause
       ✓ should fail to pause if not admin
       ✓ should fail to unpause if not admin
       ✓ should fail to claim if paused
       ✓ should be able to claim sand after pause/unpause (47ms)
    coverage
       ✓ a valid signature must verify correctly
       ✓ check the domain separator

SafeMathWithRequire.sol library via MockSafeMathWithRequire.sol
   ✓ sqrt6, sqrt multiplied by 1e6
   ✓ sqrt3, sqrt multiplied by 1e3
   ✓ cbrt6, cube root multiplied by 1e6 (106ms)
   ✓ cbrt3, cube root multiplied by 1e3 (57ms)

LandContributionCalculator
  roles
     ✓ admin should be able to call setNFTMultiplierToken (160ms)
     ✓ others should fail to call setNFTMultiplierToken (56ms)
  calculation
     ✓ zero lands
     ✓ 1 lands (61ms)
     ✓ 2 lands (80ms)
     ✓ 3 lands (86ms)
     ✓ 4 lands (95ms)
     ✓ 5 lands, to high to be minted (100ms)
     ✓ 10 lands, to high to be minted (99ms)
     ✓ 20 lands, to high to be minted (101ms)
     ✓ 50 lands, to high to be minted (99ms)
     ✓ 100 lands, to high to be minted (101ms)
     ✓ 408 lands, to high to be minted (103ms)
     ✓ 166464 lands, to high to be minted (101ms)
     ✓ 67917312 lands, to high to be minted (102ms)

LandOwnerContributionCalculator
  roles
     ✓ admin should be able to call setNFTMultiplierToken (150ms)
     ✓ others should fail to call setNFTMultiplierToken (57ms)
  calculation
     ✓ users without lands get zero contributions
     ✓ 1 lands
     ✓ 2 lands
     ✓ 3 lands
     ✓ 4 lands

PeriodicRewardCalculator
   ✓ only Admin can call setDuration (74ms)
   ✓ calling setDuration should update campaign duration
   ✓ calling setDuration during the campaing should fail
  roles
     ✓ reward pool should be able to call restartRewards
     ✓ others should fail to call restartRewards
     ✓ reward distribution should be able to call notifyRewardAmount
     ✓ other should fail to call notifyRewardAmount
     ✓ reward distribution should be able to call setSavedRewards
     ✓ other should fail to call setSavedRewards
  should be no rewards on initialization
     ✓ startup
     ✓ restart call
  reward distribution
     ✓ setup: we use the rate, so REWARDS must be multiple of duration (or leftover + reward if we add in the middle)
     ✓ we distribute rewards linearly (412ms)
     ✓ if restart is called (with contribution!=0) then rewards starts from zero again (301ms)
     ✓ calling notifyRewardAmount in the middle of the distribution will distribute the remaining + what was added (439ms)
     ✓ calling notifyRewardAmount after the distribution will distribute both amounts (384ms)

TwoPeriodsRewardCalculator
   ✓ startup (99ms)
  roles
     ✓ reward pool should be able to call restartRewards
     ✓ others should fail to call restartRewards
     ✓ reward distribution should be able to call (c) => c.runCampaign(12345678, 9876)
     ✓ other should fail to call (c) => c.runCampaign(12345678, 9876)
     ✓ reward distribution should be able to call (c) => c.setInitialCampaign(12345678, 9876)
     ✓ other should fail to call (c) => c.setInitialCampaign(12345678, 9876)
     ✓ reward distribution should be able to call (c) => __awaiter(this, void 0, void 0, function* () {
         yield c.setInitialCampaign(123, 1234);
         return c.updateNextCampaign(12345678, 9876);
      })
     ✓ other should fail to call (c) => __awaiter(this, void 0, void 0, function* () {
         yield c.setInitialCampaign(123, 1234);
         return c.updateNextCampaign(12345678, 9876);
      })
  setup restrictions
     ✓ should fail to set initial campaign if campaign is running
     ✓ should fail to set next campaign if no campaign is running
     ✓ should fail to update current campaign if no campaign is running
     ✓ run campaign always works (65ms)
  reward distribution
     ✓ run an initial campaign alone (58ms)
     ✓ run initial and next campaign (117ms)
     ✓ run next campaign after the initial one finished (189ms)
  restart reward
     ✓ before everything (40ms)
     ✓ in middle of the first campaign
     ✓ in middle of the second campaign (67ms)
     ✓ after everything (39ms)
     ✓ intermixed (68ms)

SandRewardPool
   ✓ last time reward application should match the duration (2369ms)
   ✓ total supply is at first empty
   ✓ staking should update the reward balance, supply and staking token balance (160ms)
   ✓ withdraw should update the reward balance, supply and staking token (203ms)
   ✓ reward per token should be 0 if total supply is 0
   ✓ reward per token calculation (63ms)
   ✓ earned calculation (101ms)
   ✓ get reward should transfer the reward and emit an event (171ms)
   ✓ exiting should withdraw and transfer the reward (122ms)
   ✓ pool contains reward tokens
   ✓ user can earn reward tokens if pool has been notified of reward (76ms)
   ✓ admin can notify to start a new reward process (without sending more reward tokens)
   ✓ user cannot earn rewardTokens if they stake after the end time (54ms)
   ✓ user earns full reward amount if there is only one staker after 1 day(s) (74ms)
   ✓ user earns full reward amount if there is only one staker after 27 day(s) (64ms)
   ✓ User with 0 LAND earns correct reward amount (89ms)
   ✓ User with 0 LAND earns correct reward amount - smaller stake (82ms)
   ✓ User with 1 LAND(s) earns correct reward amount (162ms)
```

```
    ✓ User with 3 LAND(s) earns correct reward amount (217ms)
    ✓ User with 10 LAND(s) earns correct reward amount (408ms)
    ✓ User can withdraw some stakeTokens after several amounts have been staked (129ms)
    ✓ First user can claim their reward - no NFTs (117ms)
    ✓ First user can claim their reward - has NFTs (504ms)
    ✓ A user can claim their reward after multiple stakes (728ms)
    ✓ First user can exit the pool (143ms)
    ✓ A user can exit the pool after multiple stakes (198ms)
    ✓ A user with NFTs can exit the pool after multiple stakes (654ms)
    ✓ Change externals contracts
    ✓ user earnings for 0 NFT(s) match expected reward with 1 stake(s) (72ms)
    ✓ user earnings for 0 NFT(s) match expected reward with 2 stake(s) (120ms)
    ✓ user earnings for 0 NFT(s) match expected reward with 4 stake(s) (195ms)
    ✓ user earnings for 0 NFT(s) match expected reward with 10 stake(s) (409ms)
    ✓ user earnings for 1 NFT(s) match expected reward with 1 stake(s) (135ms)
    ✓ user earnings for 1 NFT(s) match expected reward with 10 stake(s) (885ms)
    ✓ user earnings for 2 NFT(s) match expected reward with 1 stake(s) (199ms)
    ✓ user earnings for 3 NFT(s) match expected reward with 1 stake(s) (194ms)
    ✓ user earnings for 3 NFT(s) match expected reward with 10 stake(s) (1061ms)
    ✓ user earnings for 89 NFT(s) match expected reward with 1 stake(s) (2051ms)
    ✓ user earnings for 89 NFT(s) match expected reward with 10 stake(s) (3151ms)
    ✓ Multiple Users' earnings for 0 NFTs match expected reward: 2 users, 10 stake each (945ms)
    ✓ Multiple Users' earnings for 0 NFTs match expected reward: 3 users, 1 stake each (170ms)
    ✓ Multiple Users' earnings for 1 NFTs match expected reward: 2 users, 1 stake each (252ms)
    ✓ Multiple Users' earnings for 1 NFTs match expected reward: 2 users, 10 stake each (265ms)
    ✓ Multiple Users' earnings for 3 NFTs match expected reward: 2 users, 1 stake each (357ms)
    ✓ Multiple Users' earnings for 100 NFTs match expected reward: 2 users, 1 stake each (4692ms)
    ✓ Staking with STAKE_AMOUNT plus an extra amount equivalent to 2 NFTs (82ms)
    ✓ Earlier staker gets more rewards with same NFT amount - small NFT number (238ms)
    ✓ Earlier staker gets more rewards with same NFT amount - large NFT number (4669ms)
    ✓ More lands give more rewards than earlier staker when NFT amounts are smaller (292ms)
    ✓ More lands do not give more rewards than earlier staker with large NFT amounts (5713ms)
    ✓ rewardToken in pool is more than amount notified (72ms)
    ✓ rewardToken in pool is zero (114ms)
    ✓ rewardToken in pool is less than amount notified (87ms)
    ✓ the call to notifyRewardAmount is made after users first call stake (71ms)
    ✓ user is earning rewards and pool is notified for a second time before end of current reward period (83ms)
    ✓ Multiplier & reward are correct (358ms)
  - THIS IS FALSE, EVERYBODY CAN DO IT: Only sender or reward distribution can compute sender's account

LandOwnersSandRewardPool
    ✓ users with land should be able to stake (944ms)
    ✓ users without land should revert (65ms)
    ✓ if a user sells his land we can recompute the contribution (299ms)

new SandRewardPool main contract tests
  roles
     ✓ admin should be able to call setContributionCalculator (288ms)
     ✓ other should fail to call setContributionCalculator
     ✓ admin should be able to call setRewardToken
     ✓ other should fail to call setRewardToken
     ✓ admin should be able to call setStakeToken
     ✓ other should fail to call setStakeToken
     ✓ admin should be able to call setRewardCalculator
     ✓ other should fail to call setRewardCalculator
     ✓ admin should be able to call recoverFunds
     ✓ other should fail to call recoverFunds
     ✓ recoverFunds must fail with address zero
  reward distribution
    only one user
       ✓ reward before stake (207ms)
       ✓ stake before rewards (212ms)
       ✓ stake->withdraw so total contribution == 0, stake again (170ms)
       ✓ stake->withdraw so total contribution == 0, stake again with some rewards (232ms)
    two users
       ✓ reward before stake (197ms)
       ✓ user1 stake before rewards (232ms)
       ✓ user2 stake before rewards (240ms)
    10 users
       ✓ reward before stake (4032ms)
  contribution calculation
     ✓ initial (1805ms)
     ✓ computeContribution after the user change his contribution (946ms)
     ✓ computeContributionInBatch after the user change his contribution (400ms)
  contribution calculation with rewards
     ✓ initial (579ms)
     ✓ computeContribution after users change his contribution (837ms)
     ✓ computeContributionInBatch after the user change his contribution (585ms)
  trusted forwarder and meta-tx
     ✓ should fail to set the trusted forwarder if not admin
     ✓ should success to set the trusted forwarder if admin
     ✓ setReward with meta-tx (45ms)
     ✓ stake with meta-tx (66ms)
     ✓ withdraw with meta-tx (87ms)

new SandRewardPool anti compound tests
   ✓ user can only get his rewards after lockTimeMS (177ms)
   ✓ we can disable lockTimeMS check by setting it to zero (100ms)
  roles
     ✓ admin should be able to call setAntiCompoundLockPeriod
     ✓ other should fail to call setAntiCompoundLockPeriod

ERC677Token
   ✓ Transfering tokens to ERC677Receiver contract should emit an OnTokenTransferEvent event (830ms)
   ✓ Transfering tokens to EOA
   ✓ Transfering tokens to a non receiver contract should fail
   ✓ Transfering tokens to a contract with fallback function should succeed

use withSnapshot to keep your testing environment clean
   ✓ withSnapshot doesn't care about what happen before (226ms)

Faucet
   ✓ Send cannot exceed Faucet limit amout (243ms)
   ✓ Send cannot be executed twice without awaiting (103ms)
   ✓ Send succeded for correct asked amount (68ms)
   ✓ Retrieve succeded for deployer
   ✓ Retrieve succeded for deployer with any address
   ✓ Retrieve fail for user that is not deployer
   ✓ setPeriod succeed for deployer
   ✓ setPeriod fail for user that is not deployer
   ✓ setLimit succeed for deployer
   ✓ Send with new limit succeed after limit update. (72ms)
   ✓ setLimit fail for user that is not deployer

GameMinter
  GameMinter: Calling Directly
     ✓ should fail to create GAME if user has insufficient SAND
     ✓ should allow anyone to create a game
     ✓ should allow owner to add assets (93ms)
     ✓ should charge a fee when owner adds assets (69ms)
     ✓ should allow editor to add assets (87ms)
     ✓ should allow owner to remove assets (76ms)
     ✓ should allow editor to remove assets (67ms)
     ✓ should fail if not authorized to add assets
     ✓ should fail to modify GAME if user has insufficient SAND
     ✓ should fail if not authorized to remove assets
     ✓ should fail if not authorized to set GAME URI
     ✓ allows GAME owner to set GAME URI (44ms)
     ✓ allows GAME editor to set GAME URI (51ms)
  GameMinter: Sandbox MetaTXs
     ✓ should allow anyone to create a game via MetaTx (58ms)
     ✓ should allow GAME Owner to add assets via MetaTx (101ms)
     ✓ should allow GAME Owner to remove assets via MetaTx (77ms)
     ✓ should allow GAME Owner to set URI via MetaTx (101ms)
     ✓ should allow GAME Editor to add assets via MetaTx (87ms)
     ✓ should allow GAME Editor to remove assets via MetaTx (80ms)
     ✓ should allow GAME Editor to set URI via MetaTx (134ms)

GameToken
  GameToken: Minting GAMEs
     ✓ can update the GameMinter address
     ✓ Minter can create GAMEs when _Minter is set
     ✓ should revert if trying to reuse a baseId
```

```
    ✓ gameId contains creator, randomId, chainIndex & version data
    ✓ can get the storageId for a GAME
    ✓ can get the chainIndex for a GAME
    ✓ reverts if non-minter trys to mint Game when _Minter is set
  GameToken: Mint With Assets
    ✓ fails to create if "to" address is the gameToken contract
    ✓ fails to add ERC1155 tokens to the game if Operator != GAME contract (60ms)
    ✓ fails to add ERC1155 token batch to the game if Operator != GAME contract (120ms)
    ✓ can mint Games with single Asset (94ms)
    ✓ can mint Games with many Assets (162ms)
    ✓ should fail if length of assetIds and values dont match (51ms)
  GameToken: Modifying GAMEs
    ✓ should allow the owner to add game editors
    ✓ should allow the owner to remove game editors
    ✓ should revert if non-owner trys to set Game Editors
    ✓ Minter can add single Asset (194ms)
    ✓ should bump the version number in the gameId
    ✓ Minter can add multiple Assets (196ms)
    ✓ Minter can remove single Asset (64ms)
    ✓ fails when removing more assets than the game contains
    ✓ Minter can remove multiple Assets (113ms)
    ✓ Game token should acurately track token balances for owners
GameToken: Transferring GAMEs
  ✓ current owner can transfer ownership of a GAME
  ✓ can transfer creatorship of a GAME
  ✓ transfer creatorship should revert for a non existing game
  ✓ can transfer creatorship of a GAME back to original creator
  ✓ should fail if non-owner trys to transfer a GAME
  ✓ transfer creatorship should revert for a burned game
GameToken: MetaData
  ✓ can get the ERC721 token contract name
  ✓ can get the ERC721 token contract symbol
  ✓ can get the tokenURI (42ms)
  ✓ Minter can set the tokenURI (66ms)
  ✓ should revert if ownerOf == address(0)
  ✓ should revert if not Minter
  ✓ should be able to retrieve the creator address from the gameId
GameToken: Destroying Games
  ✓ fails if "from" != game owner
  ✓ fails if sender != game owner and not metatx
  GameToken: burnAndRecover
    ✓ fails if "to" == address(0)
    ✓ fails to destroy if "to" == Game Token contract
    ✓ fails if "from" != game owner
    ✓ fails if sender != game owner and not metatx
    ✓ can destroy GAME and recover assets in 1 tx if not too many assets (99ms)
    ✓ creatorOf() should should still return original creator
    ✓ game should no longer exist
  GameToken: Destroy... then Recover
    ✓ fails to recover if the GAME token has not been burnt
    ✓ can destroy without transfer of assets (68ms)
    ✓ fails to recover if "to" address is the gameToken contract
    ✓ fails to recover assets if caller is not from or validMetaTx
    ✓ can recover remaining assets from burnt GAME in batches (127ms)
GameToken: Token Immutability
  ✓ should store the creator address, subID & version in the gameId
  ✓ should consider future versions of gameIds as invalid
  ✓ should update version when changes are made
  ✓ should use baseId (creator address + subId) to map to game Assets

          ✓ should be able to transfer 6x6 Land (322ms)
          ✓ should be able to transfer 12x12 Land (4209ms)
          ✓ should should be able to transfer multiple lands meta (530ms)
      L2 to L1
        ✓ only owner can pause tunnels
        ✓ only owner can unpause tunnels
DUMMY CHECKPOINT. moving on...
        ✓ should not be able to transfer Land when paused (186ms)
DUMMY CHECKPOINT. moving on...
        ✓ should be able to transfer 1x1 Land (165ms)
DUMMY CHECKPOINT. moving on...
        ✓ should be able to transfer 12x12 Land (1900ms)
        ✓ should not be able to transfer 2, 12x12 Land at once (2104ms)
DUMMY CHECKPOINT. moving on...
        ✓ should be able to transfer 3x3 Land (266ms)
DUMMY CHECKPOINT. moving on...
        ✓ should be able to transfer 6x6 Land (618ms)
DUMMY CHECKPOINT. moving on...
        ✓ should should be able to transfer multiple lands (818ms)
        ✓ should not be able to transfer if exceeds limit (175ms)
      Through meta Tx
DUMMY CHECKPOINT. moving on...
        ✓ should be able to transfer 1x1 Land (206ms)
DUMMY CHECKPOINT. moving on...
        ✓ should be able to transfer 3x3 Land (272ms)
DUMMY CHECKPOINT. moving on...
        ✓ should be able to transfer 6x6 Land (606ms)
DUMMY CHECKPOINT. moving on...
        ✓ should be able to transfer 12x12 Land (3398ms)
DUMMY CHECKPOINT. moving on...
        ✓ should be able to transfer 12x12 Land (3398ms)

  PolygonLandWeightedSANDRewardPool
    ✓ last time reward application should match the duration (2391ms)
    ✓ total supply is at first empty
    ✓ staking should update the reward balance, supply and staking token balance (67ms)
    ✓ withdraw should update the reward balance, supply and staking token (80ms)
    ✓ reward per token should be 0 if total supply is 0
    ✓ reward per token calculation (43ms)
    ✓ earned calculation (67ms)
    ✓ get reward should transfer the reward and emit an event (100ms)
    ✓ exiting should withdraw and transfer the reward (96ms)
    ✓ pool contains reward tokens
    ✓ user can earn reward tokens if pool has been notified of reward (58ms)
    ✓ admin can notify to start a new reward process (without sending more reward tokens)
    ✓ user cannot earn rewardTokens if they stake after the end time
    ✓ user earns full reward amount if there is only one staker after 1 day(s) (54ms)
    ✓ user earns full reward amount if there is only one staker after 27 day(s) (54ms)
    ✓ User with 0 LAND earns correct reward amount (62ms)
    ✓ User with 0 LAND earns correct reward amount - smaller stake (62ms)
    ✓ User with 1 LAND(s) earns correct reward amount (133ms)
    ✓ User with 3 LAND(s) earns correct reward amount (197ms)
    ✓ User with 10 LAND(s) earns correct reward amount (356ms)
    ✓ User can withdraw some stakeTokens after several amounts have been staked (91ms)
    ✓ First user can claim their reward - no NFTs (82ms)
    ✓ First user can claim their reward - has NFTs (367ms)
    ✓ A user can claim their reward after multiple stakes (550ms)
    ✓ First user can exit the pool (93ms)
    ✓ A user can exit the pool after multiple stakes (149ms)
    ✓ A user with NFTs can exit the pool after multiple stakes (629ms)
    ✓ Change externals contracts
    ✓ user earnings for 0 NFT(s) match expected reward with 1 stake(s) (56ms)
    ✓ user earnings for 0 NFT(s) match expected reward with 2 stake(s) (81ms)
    ✓ user earnings for 0 NFT(s) match expected reward with 4 stake(s) (141ms)
    ✓ user earnings for 0 NFT(s) match expected reward with 10 stake(s) (305ms)
    ✓ user earnings for 1 NFT(s) match expected reward with 1 stake(s) (124ms)
    ✓ user earnings for 1 NFT(s) match expected reward with 10 stake(s) (824ms)
    ✓ user earnings for 2 NFT(s) match expected reward with 1 stake(s) (164ms)
    ✓ user earnings for 3 NFT(s) match expected reward with 1 stake(s) (182ms)
    ✓ user earnings for 3 NFT(s) match expected reward with 10 stake(s) (1035ms)
    ✓ user earnings for 89 NFT(s) match expected reward with 1 stake(s) (2087ms)
    ✓ user earnings for 89 NFT(s) match expected reward with 10 stake(s) (3054ms)
    ✓ Multiple Users' earnings for 0 NFTs match expected reward: 2 users, 10 stake each (650ms)
    ✓ Multiple Users' earnings for 0 NFTs match expected reward: 3 users, 1 stake each (120ms)
    ✓ Multiple Users' earnings for 1 NFTs match expected reward: 2 users, 1 stake each (229ms)
    ✓ Multiple Users' earnings for 1 NFTs match expected reward: 2 users, 10 stake each (238ms)
    ✓ Multiple Users' earnings for 3 NFTs match expected reward: 2 users, 1 stake each (363ms)
    ✓ Multiple Users' earnings for 100 NFTs match expected reward: 2 users, 1 stake each (4758ms)
    ✓ Staking with STAKE_AMOUNT plus an extra amount equivalent to 2 NFTs (69ms)
    ✓ Earlier staker gets more rewards with same NFT amount - small NFT number (224ms)
    ✓ Earlier staker gets more rewards with same NFT amount - large NFT number (6274ms)
    ✓ More lands give more rewards than earlier staker when NFT amounts are smaller (280ms)
    ✓ More lands do not give more rewards than earlier staker with large NFT amounts (4810ms)
    ✓ rewardToken in pool is more than amount notified (56ms)
    ✓ rewardToken in pool is zero (79ms)
    ✓ rewardToken in pool is less than amount notified (72ms)
    ✓ the call to notifyRewardAmount is made after users first call stake (61ms)
    ✓ user is earning rewards and pool is notified for a second time before end of current reward period (69ms)
    ✓ Multiplier & reward are correct (360ms)
    ✓ Only sender or reward distribution can compute sender's account

  PolygonSANDRewardPool
    ✓ last time reward application should match 30 days (652ms)
    ✓ total supply is at first empty
    ✓ staking should update the reward balance, supply and staking token balance
    ✓ withdraw should update the reward balance, supply and staking token (52ms)
    ✓ reward per token should be 0 if total supply is 0
    ✓ reward per token calculation
    ✓ earned calculation (57ms)
    ✓ get reward should transfer the reward and emit an event (70ms)
    ✓ exiting should withdraw and transfer the reward (73ms)
```

```
PolygonSand.sol Meta TX
  transfer
    ✓ without metatx
    ✓ with metatx
  approve and transferFrom
    ✓ without metatx
    ✓ with metatx (62ms)
  burn
    ✓ without metatx
    ✓ with metatx (39ms)

    ✓ should fail to set the trusted forwarder if not owner
    ✓ should success to set the trusted forwarder if owner
  approveAndCall
    ✓ without metatx
    ✓ with metatx (45ms)
  paidCall
    ✓ without metatx
    ✓ with metatx (46ms)

PolygonSand.sol
  Bridging: L1 <> L2
    ✓ should update the child chain manager
    ✓ should fail if not owner when updating the child chain manager
    ✓ should fail when updating the child chain manager to address(0)
    ✓ should be able to transfer SAND: L1 to L2 (1429ms)
    ✓ should be able to transfer SAND: L2 to L1 (1374ms)
  Getters
    ✓ gets the correct name of the Sand Token
    ✓ gets the correct symbol of the Sand Token

SandBaseToken.sol
  Deployment
    ✓ total supply should be 3,000,000,000 * 10^18 (205ms)
  Transfers
    ✓ users should be able to transfer some of the token they have
    ✓ users should be able to transfer all token they have
    ✓ users should not be able to transfer more token than they have
    ✓ users should not be able to transfer token they dont have
    ✓ users balance should not move if they transfer token to themselves
    ✓ total supply should not be affected by transfers
  Allowance
    ✓ user should not be able to transfer more token than their allowance permit
    ✓ user should be able to transfer some of the amount permitted by their allowance
    ✓ user should be able to transfer all tokens that their allowance permit
    ✓ burn test

PolygonSandClaim
  ✓ fetches the given amount of fake sand from user and transfers the same amount of new sand (494ms)
  ✓ reverts if claim amount is more than balance
  ✓ returns the amount of sand which has been claimed

SandPolygonDepositor
  ✓ Locking funds in sand predicate mock contract (363ms)

RaffleTheDoggies
  - should be able to mint with valid signature
  - should be able to mint 10_000 different tokens
  - should be able to mint 10_000 different tokens in 3 waves
  - should be able to mint 10_000 different tokens in 3 waves in 3 txs

ERC20BasicApproveExtension
  ✓ ApproveAndCall calling buyLandWithSand (1556ms)
  ✓ ApproveAndCall should fail for input data too short
  ✓ ApproveAndCall should fail for first parameter != sender
  ✓ ApproveAndCall should fail for zero data
  ✓ ApproveAndCall should fail for Approving the zeroAddress
  ✓ ApproveAndCall should work for target = EOA with ether value = 1
  ✓ ApproveAndCall should work for target = EOA with ether value = 0
  ✓ ApproveAndCall for an empty contract as a target should revert
  ✓ ApproveAndCall calling logOnCall of a mock contract (38ms)
  ✓ ApproveAndCall with only one parameter should fail
  ✓ ApproveAndCall calling revertOnCall of a mock contract should fail
  ✓ PaidCall calling buyLandWithSand (279ms)
  ✓ PaidCall should fail for input data too short
  ✓ PaidCall should fail for first parameter != sender
  ✓ PaidCall should fail for zero data
  ✓ PaidCall should fail for Approving the zeroAddress
  ✓ PaidCall should work for target = EOA with ether value = 1
  ✓ PaidCall should work for target = EOA with ether value = 0
  ✓ PaidCall for an empty contract as a target should revert
  ✓ PaidCall calling logOnCall of a mock contract
  ✓ PaidCall calling revertOnCall of a mock contract should fail

Gems & Catalysts permit
  ✓ user can use permit function to approve Gems via signature
  ✓ user can use permit function to approve Catalysts via signature
  ✓ updates a users allowances correctly
  ✓ should fail if deadline < block.timestamp
  ✓ should fail if recoveredAddress == address(0) || recoveredAddress != owner
  ✓ should fail if owner == address(0) || spender == address(0)

Sand.sol
  Deployment
    ✓ total supply should be 3,000,000,000 * 10^18
  Transfers
    ✓ users should be able to transfer some of the token they have
    ✓ users should be able to transfer all token they have
    ✓ users should not be able to transfer more token than they have

Changelog

- 2022-05-11 - Initial report
- 2022-05-26 - Re-audit

About Quantstamp

Quantstamp is a Y Combinator-backed company that helps to secure blockchain platforms at scale using computer-aided reasoning tools, with a mission to help boost the adoption of this exponentially growing technology.

With over 1000 Google scholar citations and numerous published papers, Quantstamp's team has decades of combined experience in formal verification, static analysis, and software verification. Quantstamp has also developed a protocol to help smart contract developers and projects worldwide to perform cost-effective smart contract security scans.

To date, Quantstamp has protected $5B in digital asset risk from hackers and assisted dozens of blockchain projects globally through its white glove security assessment services. As an evangelist of the blockchain ecosystem, Quantstamp assists core infrastructure projects and leading community initiatives such as the Ethereum Community Fund to expedite the adoption of blockchain technology.

Quantstamp's collaborations with leading academic institutions such as the National University of Singapore and MIT (Massachusetts Institute of Technology) reflect our commitment to research, development, and enabling world-class blockchain security.

Timeliness of content

Except as described below, a hyperlink from this web site to another web site does not imply or mean that Quantstamp endorses the content on that web site or the operator or operations of that site. You are solely responsible for determining the extent to which you may use any content at any other web sites to which you link from the report. Quantstamp assumes no responsibility for the use of third-party software on the website and shall have no liability whatsoever to any person or entity for the accuracy or completeness of any outcome generated by such software.

Disclaimer

This report is based on the scope of materials and documentation provided for a limited review at the time provided. Results may not be complete nor inclusive of all vulnerabilities. The review and this report are provided on an as-is, where-is, and as-available basis. You agree that your access and/or use, including but not limited to any associated services, products, protocols, platforms, content, and materials, will be at your sole risk. Blockchain technology remains under development and is subject to unknown risks and flaws. The review does not extend to the compiler layer, or any other areas beyond the programming language, or other programming aspects that could present security risks. A report does not indicate the endorsement of any particular project or team, nor guarantee its security. No third party should rely on the reports in any way, including for the purpose of making any decisions to buy or sell a product, service or any other asset. To the fullest extent permitted by law, we disclaim all warranties, expressed or implied, in connection with this report, its content, and the related services and products and your use thereof, including, without limitation, the implied warranties of merchantability, fitness for a particular purpose, and non-infringement. We do not warrant, endorse, guarantee, or assume responsibility for any product or service advertised or offered by a third party through the product, any open source or third-party software, code, libraries, materials, or information linked to, called by, referenced by or accessible through the report, its content, and the related services and products, any hyperlinked websites, any websites or mobile applications appearing on any advertising, and we will not be a party to or in any way be responsible for monitoring any transaction between you and any third-party providers of products or services. As with the purchase or use of a product or service through any medium or in any environment, you should use your best judgment and exercise caution where appropriate. FOR AVOIDANCE OF DOUBT, THE REPORT, ITS CONTENT, ACCESS, AND/OR USAGE THEREOF, INCLUDING ANY ASSOCIATED SERVICES OR MATERIALS, SHALL NOT BE CONSIDERED OR RELIED UPON AS ANY FORM OF FINANCIAL, INVESTMENT, TAX, LEGAL, REGULATORY, OR OTHER ADVICE.
